

The **work positioning belts** are main elements of the protective system against falling from height. These safety belts assure the positioning of the worker during works and must be used as a support of the body.

The work positioning belt is personal protective equipment that contains a lumbar protective element (known as a lumbar protection) and a textile belt provided with length adjustment elements and with the necessary elements (rings) for anchoring the user. The anchoring rings are metallic and positioned sideways in order to allow the use of the belt along with the fix or adjustable safety lanyards.

Work positioning belt PB-70

Code: PB-70
